## Windows Server 2003 coming to an end? Switch from on-premises to AZURE!

Windows Server 2003 has been good to you. But all good things must come to an end. In June 2015, Microsoft support for Windows Server 2003 will cease, meaning it is time to consider what to do with your servers.

The scary part of moving to a new operating system version is application compatibility. How are you going to make sure your applications will continue to work on a new platform? Microsoft Azure offers an excellent way to test this, and may offer a new way to host your servers and applications.

### Itergy's Solution

Itergy offers a solution that can get you started down the road of testing your applications with a minimal investment. With this pay-per-usage model, you can see what effect the new OS will have on your applications without making a large investment in hardware, which provides you a lot of flexibility. We do this by setting up a virtual test environment in Azure, which you can then leverage for testing your Windows Server Upgrade. Moreover, your Azure Windows Server 2003 Upgrade Lab will enable you to create realistic scale tests and to connect globally to your on-premises network.

Our solution includes:

- Five-day on-site design and implementation services
- Virtualization of up to three servers in the Azure lab environment
- Access to a multidisciplinary team, with an assigned expert for the project
- Free Microsoft Azure cloud services trial period
- Three-month post-configuration checkup

### Top Features

- Expert knowledge transfer
- Quick and easy deployment
- Free Azure usage trial period
- Pay-as-you-go usage
- Three-month post-configuration checkup

### Pricing

We can help set up your Azure Windows Server 2003 Upgrade Lab, starting at only \$6,500 for the entire process.

Once we've deployed your test environment, we can also be the go-to expert for your on-premises / hybrid / cloud migration project.

Contact us today, and find out more about our solutions.

### Testing on Microsoft Azure

The Microsoft Azure platform allows you to create a cloud-based lab so you can develop and/or test your application while significantly reducing delivery time and costs. Moreover, you have the flexibility to add or remove different components in the test lab as testing requirements change.

Solution example:

### How It Works

At Itery, our proven methodology has permitted us to successfully configure cloud-based test environments for our customers. Here's how we do it.

First, we sit down with you to discuss your business needs and objectives to get a better idea of your situation. Second, we analyse your current application environment and create the plan for your Azure Windows Server 2003 Upgrade Lab. Once the plan is completed, we configure your Azure tenant (up to three servers) and finalize the project. Then our expert trains your test team on how to use Azure. The whole process takes no more than five days. We proactively manage the process to make sure that we complete the installation smoothly and that you leverage all the benefits of your Azure test lab. Finally, we perform a three-month checkup to analyse your Azure environment usage and provide recommendations if necessary.

### Key Benefits

- Ensures compatibility of your applications on the new OS
- Quickly deploys a lab and meets the Windows Server 2003 end-of-life deadline
- Enables you to scale your lab environment dynamically to test your different applications
- Offers potential total cost-of-ownership savings of ~30%, with minimized upfront investment vs. on-premises lab
- Provides 20-30X faster hardware provisioning and delivery vs. on-premises lab
